Oleksii Odarchuk

Backend Developer (Go) · Creator of rombik and the Piton language

Kyiv, Ukraine +380 68 645 61 42 me@ishawyha.dev
@NeShawyha github.com/OlexiyOdarchuk ishawyha.dev

Backend engineer (Go) with a product mindset and half a year of commercial experience. 1st at BEST Hackathon 2026, 3rd at Mate Hackathon, a personal invitation to DOU Day 2026. From hackathon MVPs to production Go services.

1st	11 langs	2000×	150+
place · BEST Hackathon 2026	in my own rombik engine	speed-up (SHMiner)	bot users (first year)

💼 EXPERIENCE

Backend Developer (Go)

October 2025 — present

SkyService

- Design and build **architecturally complex Go microservices from scratch** for a production platform: interface-driven (hexagonal) architecture, inter-service communication, work under real production load.
- **Designed an AI orchestrator — a web analog of claude-code**: a control-plane / execution-plane split — Claude runs through a tool-use loop while **all agent code executes inside isolated Docker sandboxes**. Core guarantee, **enforced by an automated test**: secrets (Anthropic key, git tokens) **never reach the sandbox**. MCP-over-SSE, credential-free git (GitHub App), an **egress-allowlist proxy** against exfiltration, a container-lifecycle supervisor.
- **AI support-bot platform (RAG):** semantic memory on PostgreSQL + pgvector (text / vector / hybrid search), a self-learning knowledge graph, an MCP server, schema-per-tenant isolation, token-based billing.

Embedded Engineering Intern

September 2026 — now

Ajax Systems — Ajax Lab (KAI)

- Intensive offline internship: ARM and cross-compilation, secure boot, the Linux kernel, RootFS, BSP / Device Tree, drivers; capstone — a custom OS and device on a Raspberry Pi 5 / BeagleY-AI.

💡 HOW I WORK

- **I own products end-to-end** — from the compiler and engine to billing and deploy (rombik, Piton — all mine).
- **Security by default** — I find and close vulnerabilities (egress-allowlist, secrets out of the sandbox, ECDSA webhooks).
- **I love the foundations, not just CRUD** — compilers, tree-sitter, my own language, distributed systems.
- **Fast to ramp up** — a working Go backend in 7 hours at a hackathon; complex production services within half a year.

🎟 DOU Day 2026 — personal invitation

Personally invited by the organisers to the conference with a free ticket — while still a student.

🛠 TECH STACK

Languages: Go · Python · C · TypeScript

Backend: Gin · Fiber · REST API · WebSockets · SSE · Goroutines · JWT · OAuth 2.0 · rate limiting

Databases: PostgreSQL · pgvector · Redis · ClickHouse

Frontend: Svelte · Wails · Tailwind

AI: Anthropic Claude · OpenAI · MCP · RAG · fal.ai

DevOps: Docker · Kubernetes · AWS (EC2) · nginx · Linux (Arch) · Git · TinyGo · Typst

Testing / observability: OpenTelemetry · structured logging · golden tests

🎭 BEYOND CODE

10 years on stage — contemporary and folk dance: performances and productions.

I write for theatre: author of the full-length Christmas féerie **“Uncharted Star”** (seven scenes, original story) — about a girl-engineer who, in a world that turns everyone into obedient cogs, proves that knowledge and a soldering iron beat any magic.

The stage gave me confident public delivery and discipline — useful for demos and teamwork alike. And writing a play is also about structure: scene logic, rhythm, characters as modules. I like it when engineering thinking and creativity work together.

🎓 EDUCATION & LANGUAGES

Software Engineering
Taras Shevchenko National University of Kyiv (FIT)
2026 — present

Network Technologies
IT College NULP
2024 — 2026

IT Class
Science Lyceum, Rivne
2022 — 2024

Ukrainian — native · **English** — B1

🌐 OPEN SOURCE

Libraries, bots and the **Piton** language — **@OlexiyOdarchuk**. rombik is private, with a public API.

🚀 WINS & HACKATHONS

🏆 1st Place — Lead Backend & Sensor Fusion
April 18–19, 2026

BEST Hackathon 2026 — GPS-less Drone Trajectory

- Algorithm to **reconstruct a UAV’s trajectory without GPS** from IMU/barometer logs. Sensor fusion in **Go + C**: Go for the pipeline & integration, C for the hot numerical kernels.
- **1st place among top teams** — judges singled out the architectural resilience: modular split telemetry / integration / simulation let us swap datasets without rewriting.

🥉 3rd Place — Backend Engineer
March 14, 2026

Mate Hackathon (50 participants, 10 teams)

- Designed and built a Go backend from scratch in **7 hours** for an AI-powered MarTech tool that automates competitor-ad analysis.
- Dual AI pipeline: GPT-4o for trigger analysis + fal.ai for creative generation; backend routed all AI calls under load. Beat teams with 5+ years of experience.

Security Researcher → Job Offer
2026

College Blockchain System “Student Hryvnia”

- Discovered and exploited a critical vulnerability: the **backend never checked transaction amounts** (only the frontend) → arbitrary negative-value transfers. Reported responsibly — received a job offer.
- Reverse-engineered the official JS miner via Webpack bundles — then a faster Go replacement with a native Rust core (SHMiner — in Projects).
- Mate Conf ticketing platform: a 100% promo code was scoped to one ticket, but the backend trusted the discount parameters from the client → it could be moved onto the whole cart (any number of tickets for free). Reported responsibly — the bug was fixed.

🔑 KEY ENGINEERING DECISIONS

- **2000× speed-up** — SHA-256 moved from JS to Go with a goroutine worker-pool, then into a native Rust core: same machine, 5400 blocks/min instead of 2–3 (SHMiner).
- **Pixel-for-pixel to DSTU** — byte-exact golden tests for flowchart rendering across 11 languages: zero drift from the standard (rombik).
- **Secrets out of the sandbox** — an egress-allowlist proxy + an automated test proving keys and tokens never reach the agent’s code (boorevіy).
- **A compiler from scratch** — parser → IR → layout → render on tree-sitter; craft carried over from my language Piton.

💻 PROJECTS

FLAGSHIP · COMMERCIAL micro-SaaS

website → API →

🔷 rombik — Flowchart Generator

My first full-fledged commercial micro-SaaS · code in 11 languages → a DSTU 19.701-90 / ISO 5807 flowchart or structogram

Designed and run entirely by me. A **Go engine** — a compiler pipeline (parser → IR → layout → render) on **tree-sitter** for **11 languages** (Python, JavaScript, TypeScript, C, C++, C#, Java, Go, Rust, PHP, Pascal); flowcharts and Nassi–Shneiderman structograms, pixel-for-pixel to DSTU 19.701-90 / ISO 5807, byte-exact golden tests. Web editor, 12 formats (Word·Visio·draw.io as native shapes, SVG/PNG/PDF, Typst, Excalidraw, animated GIF). **Subscriptions via plata by mono on my own go-monobank-sdk** + Paddle. Compiler craft carried over from my language **Piton**. Public **API**, **CLI in Rust**, **MCP server**, an AI skill, a Telegram bot for study groups, describe→flowchart via AI.

Go · Gin | tree-sitter | API · MCP | CLI in Rust | Telegram bot | go-monobank-sdk | PostgreSQL | DSTU

OPEN SOURCE SDK

go-monobank-sdk — Go SDK for every monobank API

github →

Full coverage of **personal**, **provider** (with monoКЕП), **business** for legal entities, **acquiring** (subscriptions, monopay button, split-receivers, T2P) and **Installment Purchases**. ECDSA webhook verification with auto-rotating keys, drop-in `http.Handler`, typed money/currency/MCC, HMAC-SHA256 for installment callbacks, a fake monobank server for tests, and a separate OpenTelemetry sub-module.

Go | ECDSA | HMAC-SHA256 | OpenTelemetry | iter.Seq2

SDK CONSUMER

monokasa — Telegram Ticket-Selling Bot

github →

Sells tickets to a single show through a monobank jar and issues PDFs with QR codes scanned at the venue entrance. Live consumer of my own **go-monobank-sdk**: webhook auto-registers at startup, reservations get a 15-minute hold, and show-time reminders fire at-most-once even across restarts.

Go | SQLite | telebot | PDF + QR | go-monobank-sdk

2000× FASTER

SHMiner — Desktop Crypto Miner

github →

Cross-platform desktop miner built with **Wails (Go + Svelte/TypeScript)**. Rewrote SHA-256 hashing from JS to Go with a goroutine worker pool, then moved the search into a native **Rust** core on hardware SHA instructions — achieved **2000× faster hashrate** than the official client on identical hardware. AES-encrypted wallet storage, real-time WebSocket dashboard, multi-wallet, zen mode.

Go | Rust | Svelte | TypeScript | Wails | WebSockets | Goroutines

150+ USERS

AbitAssistant Bot

github →

Telegram bot helping Ukrainian students track university admission rankings. Reverse-engineered closed third-party APIs to fetch live competition data. **150+ active users in first year**, marketing campaign planned for 2026.

Python | Aiogram | PostgreSQL | BeautifulSoup | Pandas | Docker

ANDROID + PWA

Vidbiy

website → github →

An alarm clock aware of air-raid alerts: wakes you right at the all-clear, or at a set time — and if an alert is on then, after it ends. **Android** on Kotlin/Compose (system alarm, foreground service) and a **PWA** for iPhone and desktop; proxy on **Cloudflare Workers**.

Kotlin | Compose | AlarmManager | PWA | Cloudflare Workers

MY OWN LANGUAGE

Piton — My own programming language

github → docs →

Ukrainian transliterated language + interpreter, from scratch in **Go without yacc/bison**: recursive descent parser, tree-walking evaluator, Turing-complete. Flowcharts via a **D2** engine; compiled to **WebAssembly via TinyGo** (220 KB). Now rewriting it in **Rust**.

Go | Rust | TinyGo | WebAssembly | Nix

ALSO

LinkShortener Bot github →
Telegram bot: QR, geo-analytics on ClickHouse, Redis cache.

ToDoList Pro github →
Task manager: Go/Gin + Svelte 5, JWT + OAuth 2.0, Swagger.
